

ST-Perf®

The only tool for analyzing data transfer rates during backups with NetWorker®

ST-Perf helps you optimize your NetWorker setup with respect to data transfer rates, allowing you to detect quickly any performance problems or suboptimal device configurations.

Features:

- No limit to number of devices that can be analyzed at the same time
- Multiple NetWorker servers
- Show tape action, number of sessions, NetWorker messages, active SaveSets
- SRS / DDS support
- Customizable colors for display of performance graph
- Interactive configuration via GUI or command line
- Free scheduling of duration, interval and start time of recording

Function:

ST-Perf records device data at definable intervals over a freely selectable time period and writes the data relevant to the device analysis into a defined data field. The analysis module reads the recorded performance figures and converts them into diagram form.

The graphical portrayal of the data lets you identify at a glance:

- when a device was used
- what write throughput was reached at any specific time
- how many backups were written in parallel on any one device
- where there is free space for further backups
- which SaveSets were backed up and when

When using SRS or DDS, it is not immediately clear how the hardware is assigned to the logical drives of a NetWorker server. It is also difficult to determine the capacity utilization of the individual physical drives. ST-Perf shows you which drive assembly is assigned to which StorageNode at what time, so that a thorough analysis of the capacity utilization of the drives is possible even when using SAN drives (DDS support in preparation).

Benefit to you:

- You identify unused resources
- You avoid drive losses by recognizing and preventing constant start/stop operation
- You can better schedule your backups
- You recognize frequent and possibly unnecessary tape changes
- You are able to discover bottlenecks in your installation
- You avoid the need for additional, often expensive hardware

Prices:

Linux Solaris

NetWorker Server, small (4 LW)	950€	1425€
NetWorker Server, large (> 5 LW)	1900€	2850€
SRS support	2450€	3675€

The above rates are net prices and applicable per licensed NetWorker server (HostID/Enabler)
Other license models (e.g. more than 4 servers, mobile installation for support) on request.

Optional servicing contract
(support, bug fixes, updates etc.):
25% of total license costs as listed above

For further information as well as a limited demo version of the product please visit our website:
